

At **Beyond Innovations**, we create highly efficient medium-sized (1 kW to 10 kW) wind turbines with blades made from lightweight materials.

**Its ingenious and unique design makes it perfect for urban areas, cities, and highly populated sectors. Our wind turbines can be easily installed on balconies, in parks, along the side of roads, or on the roofs of houses or commercial buildings.**

With this turbine, we want to provide a grid-synced inverter for two reasons.

*First, so clients could still use the grid's electricity during their peak consumption.*

*Second, the inverter can sell back the surplus electricity to the grid, again lowering the client's electricity bill.*

Our aim is for the retail price of a **Beyond Innovations** wind turbine to be less than half that of the current offerings.
